Experiment 8

User Management and Role-Based Access Control
Application: Insurance Claim Request & Processing Management

Aim

To implement User Management and Role-Based Access Control in Zoho Creator to manage users, assign roles and control access to application features and data based on the permissions granted to each role.

Introduction

User management in Zoho Creator controls who can use an application and what each user may do. A **role** defines the position in the organisation hierarchy and what data is visible; a **profile / permission set** defines which forms, reports and pages can be viewed, added, edited, deleted or exported. Together they implement role-based access control (RBAC).

Roles and Permissions for the Claim Application

Role	Claim_Request_Form	Claim_Request_Report	Command Center page	Export
Administrator	Full	All records	Yes	Yes
Branch Manager	View / Edit	All records	Yes	Yes (Excel)
Claims Officer (Processing Team)	Add / View / Edit	All records	Yes	No
Surveyor	View	Assigned claims only	Limited	No
Policyholder / Claimant	Add	Own claims only	No	No

Procedure

1 Open the Insurance Claim Request application and go to **Settings → Users & Permissions**.
2 Create the roles listed above and arrange them in a hierarchy.
3 Create permission profiles and set form, report and page access.
4 Add record-level criteria (e.g. Surveyor sees only claims where Surveyor_Assigned = logged-in user).
5 Invite users by e-mail and assign each a role and profile.
6 Test by logging in as each role and checking what is visible.

Output – User Management Flow

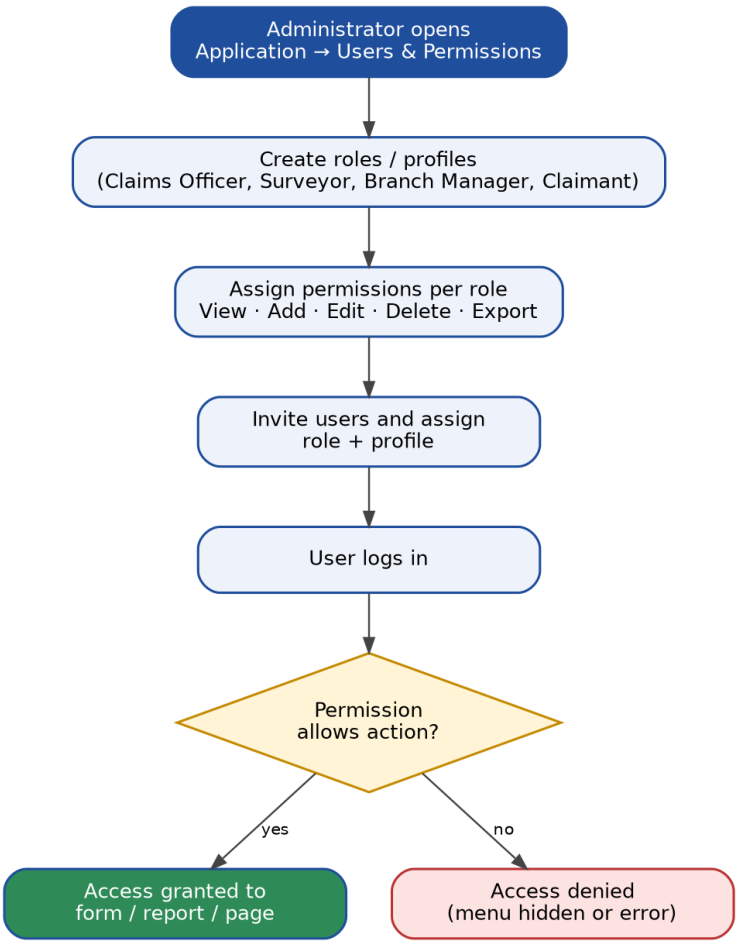

Figure 8.1 – User management and role-based access control flow

Result

User Management and Role-Based Access Control were implemented in Zoho Creator so that each user of the Insurance Claim application can access only the features and records permitted by their role.
