Experiment 9

AI and Data Analytics using Zoho Zia
Application: Insurance Claim Request & Processing Management

Aim

To implement AI and data analytics using Zoho Zia in Zoho Creator to analyse insurance claim data, identify trends and support predictions.

Introduction

Zia is Zoho's AI assistant. In Zoho Creator, Zia-based capabilities (such as AI form fields like OCR and object detection, report insights and prediction features, depending on the plan and region) help analyse data, find trends and automate data entry. For the claim application, Zia can extract text from repair estimates, identify objects in damage photos and highlight unusual patterns in claims.

Procedure

1 Log in to Zoho Creator and open the Insurance Claim Request application.
2 Make sure the application has enough sample claim records (different types, amounts and dates).
3 Add an AI field (for example OCR) to read text from the repair estimate upload.
4 Open reports such as ClaimType_Amount_Summary and the Chart report and review the insights and trends.
5 Create dashboard charts for claim count by type, amount by month and settlement rate.
6 Review the findings and note which claim types and periods need attention.

Uses of AI and Analytics in the Claim Application

Feature	Use
OCR (AI field)	Auto-read amounts and dates from scanned repair estimates and bills
Object detection	Identify damaged parts in uploaded photos for preliminary assessment
Report insights	Spot trends in claim volume and amount by claim type
Prediction / scoring	Flag claims that need closer fraud review
Dashboards	Visualise key metrics for the Branch Manager

Output – AI and Analytics Flow

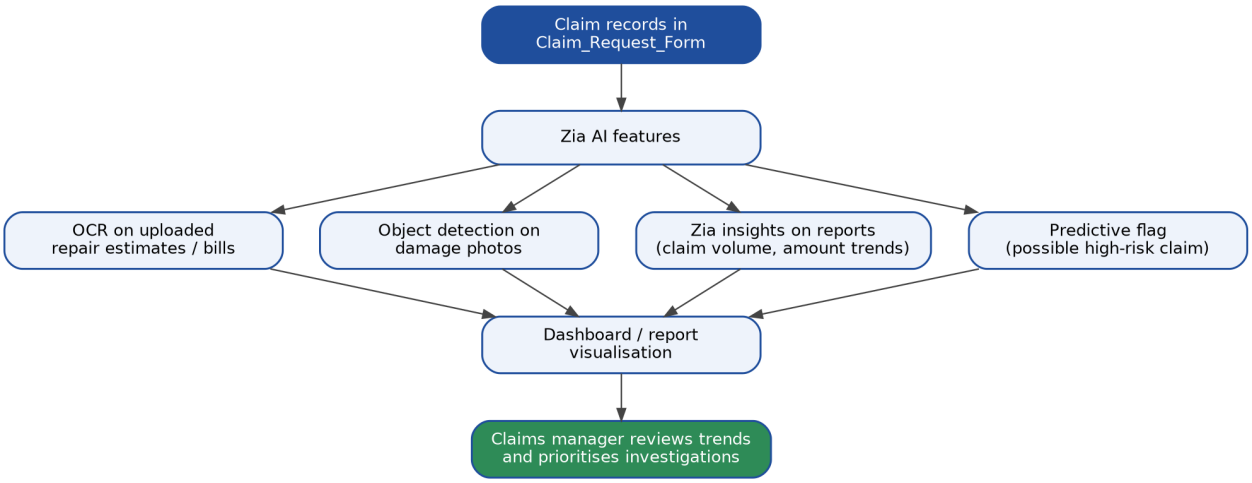

Figure 9.1 – AI and analytics workflow using Zia

Result

AI and analytics using Zia help analyse insurance claim data, visualise important metrics and identify claim trends in Zoho Creator.
