Experiment 10

Performance Optimization of the Claim Application
Application: Insurance Claim Request & Processing Management

Aim

To optimise the performance of the Zoho Creator Insurance Claim application by improving form loading speed, reducing unnecessary database operations, optimising Deluge scripts and ensuring efficient report generation.

Procedure

1 Log in to Zoho Creator and open the Insurance Claim Request application.
2 Review the claim forms and remove unnecessary fields, scripts and workflows.
3 Optimise Deluge scripts by avoiding repeated database queries and unnecessary loops.
4 Use criteria-based record fetching to retrieve only the required claims.
5 Optimise reports by showing only essential columns and applying suitable filters.
6 Reduce unnecessary workflow executions and avoid duplicate e-mail notifications.
7 Test the application after the changes to compare loading speed and responsiveness.
8 Verify that all claim features still work correctly.

Deluge Optimisation Example

Before (slow)	After (optimised)
Fetch every claim, then loop and test each one in the script	Fetch only the needed records with criteria in the query
Query the database inside a loop for every claim	Fetch once, reuse the result
Report shows all 25 columns for every claim	Report shows only 6 essential columns with filters

```
// BEFORE
all = Claim_Request_Form[ID != 0];
for each c in all { if(c.Status == "Submitted") { ... } }

// AFTER
pending = Claim_Request_Form[Status == "Submitted" && Claim_Amount_Requested > 100000];
for each c in pending { ... }
```

Output – Optimisation Flow

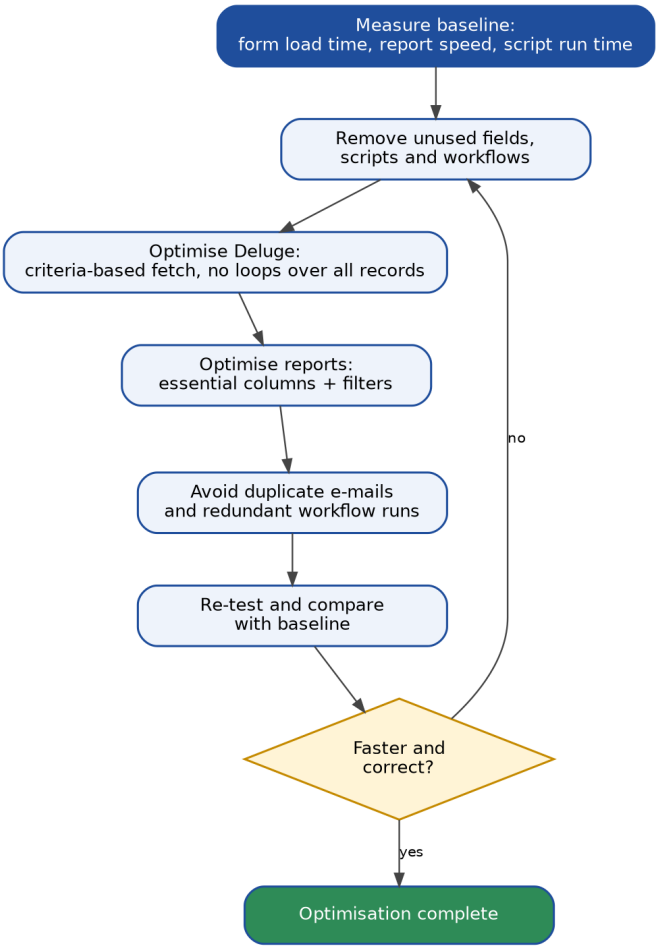

Figure 10.1 – Performance optimisation workflow

Result

The performance of the Insurance Claim application was improved by removing unnecessary fields and scripts, using criteria-based fetching, simplifying reports and avoiding duplicate workflow runs.
