Experiment 12

Security and Governance in the Claim Application
Application: Insurance Claim Request & Processing Management

Aim

To implement security and governance in the Insurance Claim application using role-based access control, user permissions, data protection and workflow restrictions so that claimant information is accessed only by authorised users.

Procedure

1 Log in to Zoho Creator and open the Insurance Claim Request application.
2 Create user roles such as Administrator, Branch Manager, Claims Officer, Surveyor and Claimant.
3 Configure permissions for viewing, adding, editing, deleting and exporting claim records.
4 Restrict data access with report permissions and record-level rules to protect claimant information.
5 Secure forms by making essential fields mandatory and validating inputs.
6 Configure authentication settings so only authorised users can access the application.
7 Protect workflows: review Deluge scripts, e-mail notifications and integrations for unauthorised data access.
8 Audit application activity using audit logs and monitoring features.
9 Test security by logging in as different roles and checking that each sees only permitted features and records.

Security Measures for the Claim Application

Area	Measure
Roles and permissions	Least-privilege access per role; Excel export only for Branch Manager
Data protection	Claimant personal data and documents visible only to authorised roles
Form security	Mandatory fields, format validation and digital signature
Workflow security	Approval for high-value claims; Blueprint restricts stage changes by role
Monitoring	Audit logs of important changes

Output – Security Flow

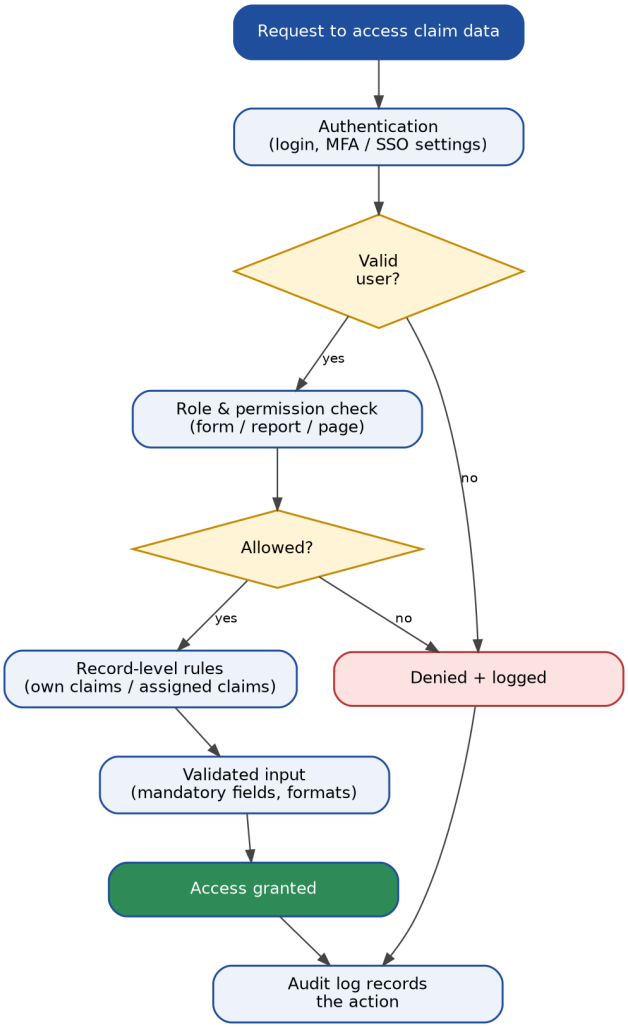

Figure 12.1 – Security and governance flow

Result

Security and governance were implemented in the Insurance Claim application using role-based access, permissions, data validation, workflow restrictions and activity monitoring.
