Experiment 14

Pro-Code Extension using Zoho Catalyst
Application: Insurance Claim Request & Processing Management

Aim

To study and implement a pro-code extension using Zoho Catalyst to extend the functionality of the low-code Insurance Claim application by developing custom back-end logic, APIs and advanced features that go beyond the built-in capabilities of Zoho Creator.

Introduction

Zoho Catalyst is a pro-code platform for building and deploying back-end functions, APIs, data storage, authentication and integrations using programming languages. A pro-code extension combines the quick development of Zoho Creator with custom logic that goes beyond built-in features – for example a custom fraud-risk scoring service for insurance claims.

Procedure

1. Sign in to Zoho Catalyst and create a new project (for example InsuranceClaimExtensions).
2. Create an **Advanced I/O function** (Node.js) named *claim_risk*.
3. Write the scoring logic and test it locally and in the console.
4. Deploy the function and note its endpoint URL.
5. In Zoho Creator, create a Connection and call the endpoint with Deluge **invokeUrl** when a high-value claim is submitted.
6. Store the returned risk score in a Risk_Score field and route high-risk claims to senior investigators.
7. Test the end-to-end flow with sample claims.

Sample Catalyst function (illustrative)

```
const express = require('express');
const app = express();
app.use(express.json());

app.post('/risk', (req, res) => {
  const { amount, claimType, priorClaims } = req.body;
  let score = 0;
  if (amount > 100000) score += 40;
  if (priorClaims >= 3) score += 35;
  if (claimType === 'Motor Insurance' && amount > 75000) score += 15;
  const level = score >= 60 ? 'HIGH' : score >= 30 ? 'MEDIUM' : 'LOW';
  res.json({ risk_score: score, risk_level: level });
});

module.exports = app;
```

The scoring rules above are a simple teaching example, not a real underwriting model.

Output – Pro-code Extension Flow

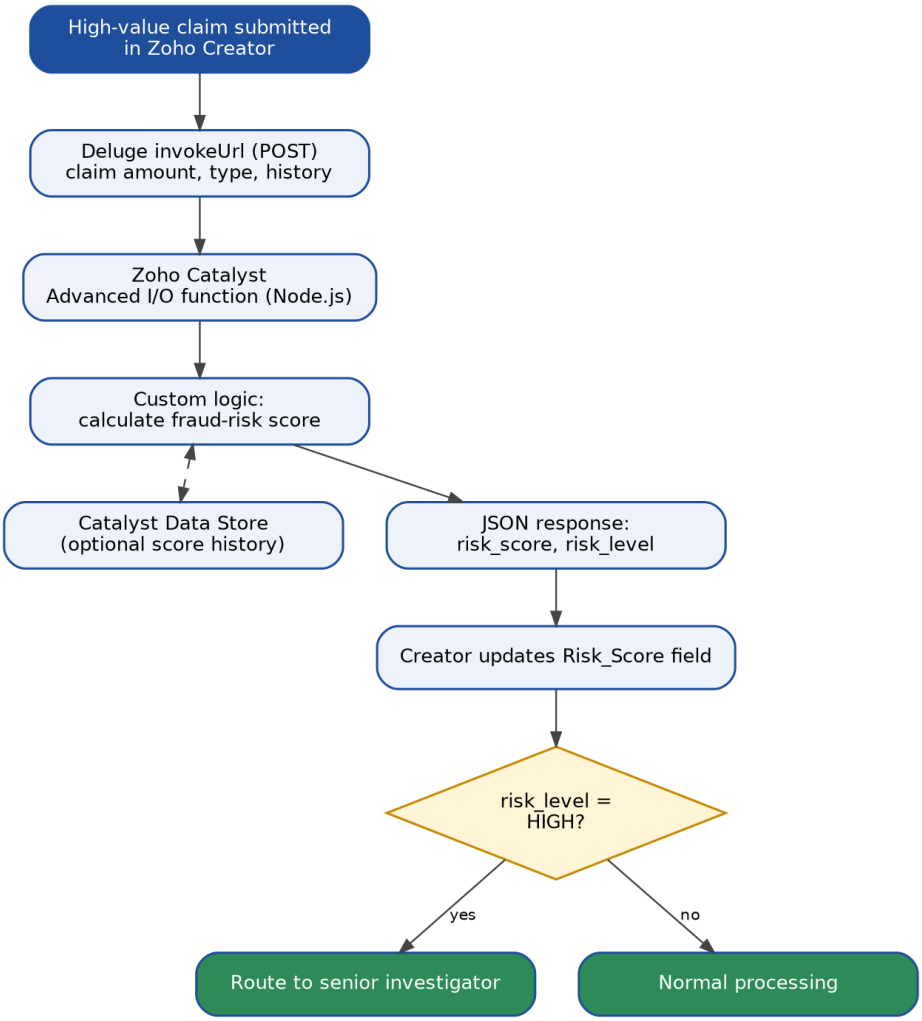

Figure 14.1 – Zoho Creator extended with a Zoho Catalyst function

Conclusion

Pro-code extension using Zoho Catalyst combines the rapid development benefits of low-code with the flexibility of traditional programming. It lets developers build custom back-end services, integrate external applications and implement advanced functionality that Zoho Creator alone does not provide.
