Experiment 15

Career Pathways in Low-Code Development
Application: Insurance Claim Request & Processing Management

Aim

To study the career pathways available in low-code development and understand how low-code platforms help individuals build applications, automate business processes, improve productivity and develop the skills needed for employment and entrepreneurship.

Introduction

Low-code development uses visual tools, drag-and-drop components, templates and minimal programming to build applications quickly. Platforms such as Zoho Creator, Microsoft Power Apps and OutSystems help organisations reduce development time, improve productivity and automate repetitive work, and they create career opportunities for both technical and non-technical people.

Career Pathways

Role	What the role does	Example in an insurance claim application
Low-Code Application Developer	Designs forms, reports and workflows and tests the application.	Builds the Insurance Claim application in Zoho Creator.
Business Process Automation Specialist	Finds repetitive tasks and automates them with workflows, schedules and approvals.	Automates acknowledgements, document reminders and high-value claim approvals.
Low-Code Solution Architect	Plans the application structure, technologies and integrations.	Plans how claims, policies, payments, documents and analytics work together.
Business Analyst	Translates business needs into application features.	Documents how a claim moves from submission to settlement.
Integration and Pro-Code Developer	Extends platforms with JavaScript, Node.js, Python, APIs and databases.	Connects a policy-verification API and a Catalyst fraud-scoring function.
Consultant and Administrator	Selects platforms, manages users, permissions, monitoring and maintenance.	Manages roles, security and deployment of the claim application.

Skills Required

Skill	Description
Platform knowledge	Understanding tools such as Zoho Creator and their features.
Database fundamentals	Storing, retrieving and managing application data.
Basic programming	Logic, conditions, loops and scripting such as Deluge.
Problem solving	Turning business problems into application solutions.
Testing and debugging	Finding errors and making sure the app works as expected.
Communication	Understanding requirements and explaining technical solutions.

Output – Career Roadmap

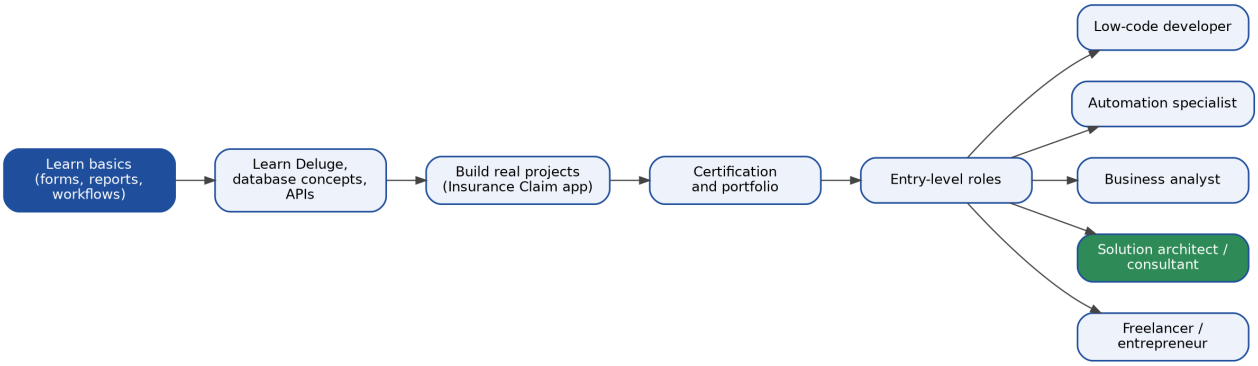

Figure 15.1 – Career roadmap in low-code development

Future of Low-Code Development

1. **Integration with AI:** AI-assisted development, data analysis and intelligent automation.
2. **Growth of business automation:** approvals, notifications, customer management and reporting.
3. **Low-code plus pro-code:** visual building for standard forms and workflows, custom code for specialised logic.
4. **Greater focus on security and governance:** permissions, data protection and compliance.
5. **Cloud-based development:** applications accessible from any location and device.
6. **Continued need for technical skills:** logic, data structures, testing, integration and security remain important.

Conclusion

Low-code development offers careers in application development, workflow automation, analysis, consulting and freelancing. Zoho Creator is suitable for beginners because of its visual tools and built-in forms, reports, workflows and dashboards. By building real projects such as the Insurance Claim application, learning database concepts and scripting, and combining low-code with APIs and AI tools, students can build a strong portfolio for entry-level IT jobs.
